

What is Code Coverage

- Code coverage is a code quality metric that helps developers and QA testers measure how much **coverage** their test suite is covering of the codebase.
- It is represented in a percentage indicating the number of lines of code being run in ratio to the total number of lines of code written.
- Low code coverage could be an indication of a test suite that is inclusive or code structure that is poorly designed and hard to test.
- DISCLAIMER : Having a high code coverage **does not guarantee** high-quality code . A code base with high coverage can still be of poor quality/performance if the tests are not thorough.
